

Homework problems:

Complete the IDSST R tutorial Programming Basics until April 22 to learn about:

- R functions and their arguments
- R objects
- R's basic data types
- R's basic data structures including vectors and lists
- R's package system

Remark:

The tutorial is created with the `learnr` package, which also needs to be installed to run the tutorial. Therefore, start with installing the `learnr` package:

```
install.packages("learnr")
```

The `idsst.rtutorials` package is available through GitHub (not CRAN). To install packages from GitHub, you need the `remotes` package. Hence, the next step is to install the `remotes` package:

```
install.packages("remotes")
```

Now you are ready to install the `idsst.rtutorials` package:

```
remotes::install_github("hgstp/idsst.rtutorials")
```

To start the tutorial, use the the following command:

```
learnr::run_tutorial("programming-basics","idsst.rtutorials")
```
